

MAJAL

CONSTRUCTION & FACILITIES MANAGEMENT ERP

نظام إدارة المقاولات والمرافق

THE COMMERCIAL SPINE OF A CONSTRUCTION BUSINESS.

Open source, on Odoo 18 Community. Bills of quantities, variations, payment certificates and cost value reconciliation on the same database as the RFIs, defects, permits and work orders that generate them.

37

Majal modules

6

document types, one engine

LGPL-3

open source

Two systems that do not meet

Field tools know what happened

Pins on drawings, snags, inspections, daily logs.
Excellent at capture. They stop at the point where a record becomes money.

Finance knows what was invoiced

A ledger, a customer invoice, a vendor bill. Excellent at recording. It has never heard of a bill of quantities.

Between them: the whole job

The bill the work was priced from, the variations that moved it, the subcontracts that committed the cost, the reconciliation that says whether the margin survived.

Re-keying is where the two numbers diverge — and the divergence is only discovered at month end, in the direction nobody wants.

The middle layer, built as Odoo modules

So the accounting, purchasing, inventory and HR underneath it are already integrated rather than interfaced. A defect raised on a drawing can become a back-charge on a subcontractor's payment certificate. A variation approved by the board appends its lines to the bill and appears in the next certificate. Nothing is re-keyed.

BASE	Odoo 18.0 Community, pinned by commit
REUSE	OCA modules pinned by revision; full accounting from a free LGPL-3 community suite
OWN	37 Majal modules across construction, facilities and platform

The executive portfolio dashboard.

Three readers, one database

Main contractors

BOQ-priced work, interim payment certificates with retention, subcontract packages, variations, cost value reconciliation, and site records that stand up in a claim.

boq · progress_billing · subcontractor · change_order · report

Developers & consultants

Drawing registers with revision control, RFIs and submittals with ball-in-court, tender packages levelled line by line, and portfolio-level commercial exposure.

drawing · rfi · submittal · tender · dashboard

Facilities operators

Asset registry on a real location hierarchy, preventive maintenance that generates its own work orders, SLAs on a business calendar, spare parts from real stores.

facility_asset · workorder · sla · contract · inventory

Subcontractors, clients and consultants arrive as free Odoo portal users — the people who only need to answer an RFI or accept a defect are not a per-seat line item.

Tender to reconciliation, on one ledger

Majal Construction Overview My Day My Workspace Executive Dashboard Commercial Exposure Approvals Projects Engineering Programme Gantt + 🔍 📄 7 🔄 10 👤

EVERY MODULE IS SHIPPED AND INSTALLABLE; MODULE NAMES ARE THE DIRECTORIES UNDER CUSTOM-ADDONS/

Colour everything and you have said nothing

ORIGINAL COLOURS FROM THE FILE

The authoring tool describing itself.

COLOURED BY ELEMENT CLASS

Useful once, for auditing an export.

SHADED — ONE MATERIAL

The default in Majal.

Colour is reserved for elements carrying an open item — an RFI, a defect, a task, a bill line — so the only thing that reads as coloured is the thing somebody has to act on. Same model, same camera, same crop.

A record, not a picture

WHAT IT DOES

INDEX	a dependency-free STEP reader pulls elements, property sets and quantities server-side — no geometry toolchain
IDENTITY	links are keyed on the IFC GlobalId, so an RFI raised against a wall survives the model being re-issued
VIEWER	storey filtering, isolate/hide, live section cut, IFC properties on selection, and 3D pins that create the record they stand for
4D	a date slider driving visibility from the dates of the programme tasks elements are linked to
EXCHANGE	BCF 2.1 archives round-trip with Solibri, Navisworks, BIMcollab and Revizto, matched on topic GUID

WHERE IT STOPS

CLASH	bounding-box overlap, not triangle-precise — a duct passing cleanly through a door opening will be reported
CAP	clash results are capped at 2000 per run, and the count skipped is kept
UNITS	IfcUnitAssignment is not read; a model authored in millimetres reports millimetres
WRITING	the module reads IFC and writes BCF; it never edits or re-exports an IFC file
FORMATS	DWG is not supported. Indexing is capped at 300 MB per file.

THESE LIMITS ARE PUBLISHED IN DOCS/BIM.MD, NOT DISCOVERED ON A JOB

The check is in the method

A groups attribute on a view hides a control; it does not stop the method being called. Majal checks the approval rule inside the action that commits the document, so it holds from a button, a script or RPC.

- RULES

kind, project and value band → a chain of signatures, configured as data rather than code
- DUTIES

the person who raised a document cannot sign it
- ORDER

a chain cannot be signed from the bottom up
- REASONS

a rejection without one guarantees a second cycle
- DELEGATION

records whose authority was used, not who was logged in

UP TO 50,000

Project manager

50,000 - 250,000

Project manager, commercial manager

ABOVE 250,000

Project manager, commercial manager, board

A day that fits on a phone

My Day collects everything assigned to one person — approvals waiting on them, their defects, inspections, tasks, RFIs and permits — on one screen, ordered by how much trouble it causes to ignore.

- MEASURED** at a real 390 px viewport, against a running instance — not assumed
- PINS** sheet PDFs render on a canvas; three taps turn a point on a drawing into a task, RFI, defect or note
- INSTALLABLE** Odoo 18 ships a manifest and service worker; Majal brands them
- OFFLINE** deliberately bounded — draft, checklist and scan actions work without signal; approvals, financial posting, deletes and BIM stay online

CAFM that knows what a promise costs

Assets that have a place

A site → building → floor → room hierarchy with criticality, warranties, meters and readings, failure codes and downtime — plus QR and NFC tags with append-only scan events.

Maintenance that starts itself

Job plans, and preventive-maintenance plans — calendar- and meter-based — that generate work orders by cron, each carrying a checklist copied from its job plan.

Promises with a clock

SLAs matched from a policy matrix on priority, type, category and criticality, with both clocks measured on a business calendar so a promise does not burn overnight.

Contracts with a margin

Annual maintenance contracts carry the SLA that was sold, keep absorbed and recoverable cost apart, and show a live margin against what they have invoiced.

Spare parts are held in real Odoo stores attached to facility locations and drawn down by work orders, so parts cost stops being a number somebody typed and becomes what left the shelf.

YOUR SERVER. YOUR DATABASE. YOUR SOURCE.

Odoo 18 Community (LGPL-3) pinned by commit, OCA modules pinned by revision, and the Majal suite itself — 35 modules declared LGPL-3, two declared AGPL-3.

- DEPLOY

docker compose, or a bare-metal install from pinned sources
- RECOVER

seven curated recovery slots, every archive verified with SHA-256, restored by an audited two-step offline procedure a live web process cannot trigger
- ACCESS

six rank-checked client roles and twelve audited capability tiers instead of raw permission grids

EVERY MODULE IN THE SUITE — 37 IN ALL

Shipped

PHASES 0-3

- Foundation: pinned Odoo core, pinned OCA and third-party addons
- Construction core: BOQ, drawings, RFIs, submittals
- Field: pins on plans, CPM programme, defects, daily logs, forms
- Commercial: subcontracts, variations, certificates, tender, CVR

In progress

PHASE 4

- Facilities asset registry with a real location hierarchy
- Job plans and preventive-maintenance generation
- SLAs on a business calendar, and maintenance contracts
- Spare parts in real stores; occupant self-service portal

Next

PHASE 5

- Drawing revision compare — side-by-side and overlay
- OCR title-block auto-naming on drawing upload
- Deeper analytics and dashboards
- Offline data capture beyond the bounded field workspace

THE FULL DEPENDENCY SPINE AND PHASE DETAIL ARE IN [DOCS/ROADMAP.MD](#)

START WITH THE SOURCE.

Read the code, read the limits, run it on your own server. Nothing here asks you to take a claim on trust.
