

MAJAL

CONSTRUCTION & FACILITIES ERP

نظام إدارة المقاولات والمرافق

THE COMMERCIAL SPINE OF A CONSTRUCTION BUSINESS.

Bills of quantities, variations, payment certificates and cost value reconciliation on the same database as the RFIs, defects, permits and work orders that generate them.

العمود التجاري لشركة مقاولات

جداول الكميات وأوامر التغيير وشهادات الدفع ومطابقة التكلفة والقيمة، على قاعدة البيانات نفسها.

open source, on Odoo 18 Community

The layer nobody sells you

Field tools know what happened on site. Finance systems know what was invoiced. Between them sits the bill of quantities the job was priced from, the variations that moved it, the subcontracts that committed the cost, and the monthly reconciliation that says whether the margin the job was tendered at still exists.

Majal is that middle layer, built as Odoo modules so the accounting, purchasing, inventory and HR underneath it are already integrated rather than interfaced. A defect raised on a drawing can become a back-charge on a subcontractor's payment certificate. Nothing is re-keyed.

The executive portfolio dashboard: commercial, programme, quality, safety and material figures gathered for every project in one call, then compared across any selection of them.

WHO IT IS FOR

Main contractors

BOQ-priced work, interim payment certificates with retention, subcontract packages, variations, CVR, and site records that stand up in a claim.

Developers & consultants

Drawing registers with revision control, RFIs and submittals with ball-in-court, tender packages levelled line by line, and portfolio commercial exposure.

Facilities operators

Asset registry on a real location hierarchy, preventive maintenance that generates its own work orders, SLAs on a business calendar, and contracts that show their margin.

Tender to reconciliation, on one ledger

Six stages, six shipped modules, one contract value that only ever moves for a reason somebody signed.

01

Tender

CONSTRUCTION_TENDER

Packages pull their scope from the bill, so the budget travels with them; bids are compared line by line, because a bid with unpriced lines has not offered the whole scope.

02

Bill of quantities

CONSTRUCTION_BOQ

Hierarchical sections and priced lines, each split into material, labour, equipment, subcontract and overhead budget. Approval locks it; revisions are versioned.

03

Subcontract

CONSTRUCTION_SUBCONTRACTOR

Awarding writes the winning price straight into a subcontract, so it lands in the reconciliation as committed cost rather than as a surprise.

04

Variation order

CONSTRUCTION_CHANGE_ORDER

Change events become priced variation orders. On approval they append their lines to the bill — adjusting the contract value even when the bill is locked — and flow into the next certificate.

05

Payment certificate

CONSTRUCTION_PROGRESS_BILLING

Certify cumulative work done per line, withhold retention (a percentage, capped), and raise the net customer invoice.

06

Cost value reconciliation

CONSTRUCTION_REPORT

Contract and certified value against budget, committed and incurred cost: earned margin, forecast final margin, and the movement against the margin the job was tendered at.

☐	Project	Name	Version	Contract Amount	Budget Cost	Margin %	% Certified	State		
☐	Al Noor Tower	Al Noor Tower — Main Contract BOQ	1	\$ 10,873,650.00	\$ 8,848,453.00	18.62	51 %	Approved		
☐	Marina Residences	Marina Residences — Main Contract BOQ	1	\$ 2,966,650.00	\$ 2,366,953.00	20.21	28 %	Approved		

The bill of quantities register: contract amount against budget cost, margin, per-cent certified and the approval state, per version.

Enforced in the method. Answered on a phone.

A groups attribute on a view hides a control; it does not stop the method being called. Majal checks the approval rule inside the action that commits the document, so it holds from a button, a script or RPC. Rules match a document's kind, project and value band to a chain of signatures — configured as data, not code.

Segregation of duties stops the raiser signing their own document. Steps are ordered. Rejections require a reason. Delegation records whose authority was used rather than who was logged in — and because each step is a record, “waiting for me” is one inbox across every wired document type.

My Day collects everything assigned to one person — approvals waiting on them, their defects, inspections, tasks, RFIs and permits — on one screen, ordered by how much trouble it causes to ignore. It was measured at a real 390 px viewport rather than assumed.

Sheet PDFs render on a canvas with status-coloured pins; three taps turn a point on a drawing into a task, RFI, defect or note. Offline is deliberately bounded: draft, checklist and scan actions work without signal; approvals, financial posting, deletes and BIM stay online.

My Day. Approvals waiting on the reader come first — somebody else is stopped until they are done.

“Waiting for me”: one query over approval steps, grouped by document type, totalled by value.

Raising a defect at a 390 px viewport: photo, location, severity, and the subcontractor who has to fix it.

A model that is a record, not a picture

IFC files are indexed server-side by a dependency-free STEP reader — elements, property sets and quantities — with no third-party library and no geometry toolchain on the server. Links are keyed on the GlobalId, the one identity IFC keeps stable across exports, so an RFI raised against a wall survives the model being re-issued. An element that disappears while carrying records is flagged, never silently deleted.

ORIGINAL COLOURS FROM THE FILE

COLOURED BY ELEMENT CLASS

SHADED, ONE MATERIAL

The same model, the same camera, three shading modes. Majal's default is the third: colour is reserved for the elements that carry an open item, so the only thing that reads as coloured is the thing somebody has to act on.

VIEWER	storey filtering, isolate/hide, live section cut, IFC properties on selection, 3D pins that create the record they stand for
4D	a date slider driving element visibility from the dates of the programme tasks elements are linked to
EXCHANGE	BCF 2.1 archives round-trip with Solibri, Navisworks, BIMcollab and Revizto, matched on topic GUID
QUANTITIES	model quantity and variance beside the billed one on every BOQ line linked to elements
LIMITS	clash testing is bounding-box, not triangle-precise, and capped at 2000 results per run; units are not read from IfcUnitAssignment; there is no IFC writing and no DWG support

AFTER HANDOVER — CAFM

Assets sit in a site → building → floor → room hierarchy with criticality, warranties, meters, failure codes and downtime. Preventive maintenance plans generate work orders by cron, each carrying a checklist copied from its job plan.

SLAs are matched from a policy matrix and measured on a business calendar, so a promise does not burn overnight. Annual maintenance contracts carry the SLA that was sold, keep absorbed and recoverable cost apart, and show a live margin.

YOUR SERVER. YOUR DATABASE. YOUR SOURCE.

Odoo 18 Community (LGPL-3) pinned by commit, OCA modules pinned by revision, and the Majal suite itself — 35 modules declared LGPL-3, two declared AGPL-3. Portal accounts for subcontractors, clients and consultants are free Odoo portal users, so the people who only need to answer an RFI do not arrive as a per-seat line item.

Deploy it

- docker compose up — Postgres and Odoo, self-hosted
- or a bare-metal install from pinned sources
- the model index works without the viewer libraries

Recover it

- seven recovery slots, database and filestore
- every archive verified with SHA-256
- restore is an audited two-step offline procedure

Read it

- public source; the licence is in every manifest
- documentation states limits as plainly as features
- design notes name what each competitor does better

Start with the source.
